RUTUJA RATHOD

Senior Java Full Stack Developer | 5 Years Experience | Immediate Joiner
(+91) 9834070167 | rutujarathod9595@gmail.com
linkedin.com/in/rutuja-rathod-a93458274 | Pune, Maharashtra, India

PROFESSIONAL SUMMARY

Senior Java Full Stack Developer with 5 years of experience — reduced system latency by 25% via Java 17 migration, async processing, and JVM tuning. Specialises in designing scalable, cloud-native microservices for enterprise telecom and banking platforms. Deep expertise in Java (8/11/17), Spring Boot, Apache Kafka, Microservices Architecture, REST APIs, React.js, and AWS. Proven track record in event-driven architecture, multitenant system design, secure API governance (42Crunch, Black Duck), and full-SDLC delivery with TDD (JUnit/Mockito) in Agile/Scrum environments. Immediate joiner.

TECHNICAL SKILLS

Programming Languages: Java 8/11/17, JavaScript, SQL

Web Technologies: HTML5, CSS3, React.js, Angular 14

Frameworks & Libraries: Spring Boot, Spring MVC, Spring Security, Spring IOC, WebFlux, Hibernate/JPA, J2EE

Architecture & Design: Microservices Architecture, Event-Driven Architecture, Multitenant Systems, System Design, OOP, Multithreading, Java Collections

Messaging & APIs: Apache Kafka, REST API Development, RESTful Web Services, gRPC

Cloud & DevOps: AWS (EC2, S3, Lambda), Docker, Kubernetes, CI/CD, Jenkins, Git, GitHub

Databases: PostgreSQL, SQL, JDBC, Hibernate/JPA, ORM, RDBMS, Redis

Testing & Quality: JUnit, Mockito, TDD, 42Crunch, Black Duck, OSS Vulnerability Scanning

Developer Tools: GitHub Copilot, Gemini, JIRA, Design Patterns

Methodologies: Agile, Scrum, Full SDLC, Code Review, Performance Tuning

PROFESSIONAL EXPERIENCE

Senior Software Engineer – Full Stack

Iris Software Technologies • Feb 2026 – Present • Pune, India

- Contributing to internal enterprise application development using Java Spring Boot microservices, focusing on REST API development, service layer logic, and backend integration.
- Writing and maintaining unit test cases using JUnit and Mockito, ensuring code quality, stability, and regression safety across assigned backend modules.
- Identifying and resolving vulnerability issues flagged in code reviews and static analysis, ensuring backend services meet enterprise security and compliance standards.
- Reviewing and refactoring backend microservices code against enterprise coding standards, Git-based version control, and structured peer code review processes.
- Participating in internal POC activities and knowledge transfer sessions, gaining exposure to cloud-native microservices patterns and Spring Boot best practices.
- Working in Agile/Scrum with sprint ceremonies, backlog grooming, and cross-team collaboration.
- Utilising GitHub Copilot for AI-assisted code generation to reduce boilerplate and accelerate backend development tasks.

Engineer II – Full Stack

Verizon • Aug 2023 – Dec 2025 • Bengaluru, India

- Architected and delivered 10+ multitenant, cloud-native microservices using Java 17, Spring Boot, Apache Kafka, and REST APIs for large-scale telecom provisioning platforms.
- Led Java 17 migration of legacy services, cutting system latency by 25% through query optimization, async processing, and JVM tuning; boosted observability and maintainability.
- Engineered event-driven pipelines using Apache Kafka for asynchronous communication across provisioning, order management, and downstream systems — lifting throughput by 30%.
- Streamlined full-stack features integrating Spring Boot microservices with React.js dashboards, giving real-time system visibility to 500+ internal operations users.
- Enforced secure API governance using 42Crunch and ran OSS vulnerability scanning with Black Duck — zero critical security findings across 3 consecutive audit cycles.
- Optimized AWS-based deployments for high scalability, fault tolerance, and monitoring across distributed, high-throughput, low-latency workloads.
- Maintained 85%+ unit test coverage via TDD with JUnit and Mockito; contributed to design reviews and Agile/Scrum sprint planning.
- Boosted team productivity using GitHub Copilot for AI-assisted code generation, reducing repetitive coding effort across the development lifecycle.

Software Engineer

MateBench Software • Feb 2021 – Jul 2023 • Pune, India

- Constructed high-performance backend services using Java, Spring Boot, and Microservices architecture, supporting 10,000+ requests per minute (RPM).
- Engineered and maintained RESTful APIs focused on scalability and low-latency performance, achieving a 25% reduction in API response time through query and logic optimization.
- Crafted Angular 14 frontend modules — components, services, reactive forms, HTTP client — consuming backend REST APIs for seamless end-to-end feature delivery.
- Established backend logic using JPA/Hibernate for efficient data persistence, ORM mapping, and transaction management across relational databases.
- Gained hands-on expertise in Apache Kafka — topics, partitions, consumer groups, offsets, and message serialization — for asynchronous event-driven messaging.
- Enforced TDD using JUnit and Mockito ensuring code quality, stability, and regression safety across all service layers.
- Resolved API performance bottlenecks through targeted tuning, exception handling, and debugging in distributed backend systems.
- Partnered with frontend and QA teams to support end-to-end feature delivery and smooth API integrations.

KEY PROJECTS

Virtual Network Services Platform (VNSP)

Verizon | Bengaluru, India • Duration: 29 Months

Tech Stack: Java 17, Spring Boot, Apache Kafka, React.js, AWS, PostgreSQL, REST APIs, Docker, Kubernetes, RHPAM/Bonita

Enterprise-grade, cloud-native self-service portal for Verizon enterprise customers to provision and manage physical and virtual network services at scale. Automates VNF deployments — SD-WAN, NGFWs, Session Border Controllers — across uCPE, VCP, AWS, and Azure, with order flows processed via event-driven Spring Boot microservices over Kafka.

- Engineered multi-pillar order flows across four stages — Order Collection, Credential Verification, Infrastructure Build, VNF Activation — each triggering the correct downstream microservice through Kafka event topics.
- Forged integrations with ESP (credential validation), IPSM (Layer-3 orchestration), ECM – Ericsson Cloud Manager (VNF lifecycle management), and SNM (Layer-2/3 network inventory).
- Configured multi-deployment-model routing — uCPE (OpenStack/Heat), VCP, AWS (CloudFormation CFT), or Azure (ARM templates) — based on BOD XML order parameters.
- Provisioned Azure model across Hub VNet, security groups, Express Routing Gateway (ERG), and VZ SCI (Secure Cloud Interconnect) for private cloud connectivity.
- Contributed to primary/secondary VNF HA on AWS and Azure — active-active provisioning across availability zones with BGP routing between VNF instances.
- Introduced Supplementary Order handling (cancel, due-date change, modifications) preserving order ID integrity while auto-incrementing version numbers.
- Launched real-time React.js dashboards backed by scalable REST APIs on AWS, providing live provisioning visibility for 500+ internal operations users.

Online Banking Application

MateBench Software | Pune, India • Duration: 29 Months

Tech Stack: Java, Spring Boot, Microservices, REST APIs, Spring Security, Hibernate/JPA, PostgreSQL, Angular 14, Spring MVC, JDBC

Secure digital banking platform for a Co-operative Bank covering account management, fund transfers, transaction history, loan processing, and cheque book services — built on a microservices backend with enterprise-grade Spring Security, ACID-compliant transactions, and high-throughput performance.

- Formulated RESTful APIs for core banking modules: account management (balance inquiry, statements), fund transfers (NEFT/IMPS simulation), loan request processing, and cheque book requests.
- Crafted Angular 14 frontend banking modules — components, reactive forms, routing, HTTP client — integrated with Spring Boot backend APIs for a seamless user experience.
- Enforced authentication and authorization via Spring Security with role-based access control (RBAC) for customer, teller, and admin roles across all banking operations.
- Established ACID-compliant transaction handling using Hibernate/JPA and PostgreSQL, ensuring full data integrity across concurrent multi-user banking transactions.
- Optimized backend services to sustain 10,000+ RPM with a 25% reduction in API response time via service-layer and query tuning.
- Introduced structured audit logging and exception handling across all API endpoints for regulatory compliance and end-to-end transaction traceability.
- Validated service reliability through TDD with JUnit and Mockito, delivering regression-safe modules with high unit test coverage.

EDUCATION

Bachelor of Technology (B.Tech / B.E.)

Savitribai Phule Pune University, Pune, Maharashtra | 2020
